Question 12.13.3.6 Explain why the experiment of tossing a coin three times is said to have binomial distribution

**Solution:** A random Variable  $X$  is said to have a binomial distribution with parameter  $n$ ,  $p$  and  $q$  ( $q = 1 - p$ )

$$\Pr(X = r) = {}^nC_r p^r q^{n-r} \quad r \in \{0, 1, 2, \dots, n\} \quad (1)$$

So, in an experiment of tossing a coin 3 times, we have  $n = 3$  and random variable  $X$  can take values  $r \in \{0, 1, 2, 3\}$  with  $p = \frac{1}{2}$  and  $q = \frac{1}{2}$   
 $\therefore$  it is said to have a binomial distribution.
